Scan Report

October 21, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was "Campus-CAM". The scan started at Wed Oct 21 21:22:53 2026 UTC and ended at Wed Oct 21 23:09:43 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview **2**
1.1 Host Authentications 2

2 Results per Host **2**
2.1 172.16.30.11 2
2.1.1 High general/tcp 2
2.1.2 Medium general/tcp 3
2.1.3 Low general/icmp 17
2.1.4 Low general/tcp 18
2.1.5 Low 22/tcp 20

1 Result Overview

Host	Critical	High	Medium	Low	Log	False P.
172.16.30.11 172.16.30.11	0	1	8	4	0	0
Total: 1	0	1	8	4	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level "Log" are not shown.
Issues with the threat level "Debug" are not shown.
Issues with the threat level "False Positive" are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 13 results selected by the filtering described above. Before filtering there were 214 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
172.16.30.11	SSH	Success	Protocol SSH, Port 22, User admin

2 Results per Host

2.1 172.16.30.11

Host scan start Wed Oct 21 21:26:38 2026 UTC
Host scan end Wed Oct 21 23:09:35 2026 UTC

Service (Port)	Threat Level
general/tcp	High
general/tcp	Medium
general/icmp	Low
general/tcp	Low
22/tcp	Low

2.1.1 High general/tcp

High (CVSS: 7.8)

NVT: Sudo Heap-Based Buffer Overflow Vulnerability (Baron Samedit) - Active Check

Product detection result
`cpe:/a:sudo_project:sudo:1.8.16`
`Detected by sudo / sudoers Detection (Linux/Unix SSH Login) (OID: 1.3.6.1.4.1.25`
`↪623.1.0.117185)`

Summary
Sudo is prone to a heap-based buffer overflow vulnerability dubbed 'Baron Samedit'.

Quality of Detection (QoD): 100%

...continues on next page ...

... continued from previous page ...

Vulnerability Detection Result
Used command: sudoedit -s '\' `perl -e 'print "A" x 65536'`
Result: sudoedit -s '' `perl -e 'print "A" x 65536'`
Segmentation fault (core dumped)
]0;admin@makane: ~admin@makane:~$

Solution:
Solution type: VendorFix
Update to version 1.8.32, 1.9.5p2 or later.

Affected Software/OS
Sudo versions 1.7.7 through 1.7.10p9, 1.8.2 through 1.8.31p2 and 1.9.0 through 1.9.5p1 in their default configuration.

Vulnerability Insight
Sudo is allowing privilege escalation to root via 'sudoedit -s' and a command-line argument that ends with a single backslash character.

Vulnerability Detection Method
Runs a specific SSH command after the login to the target which is known to trigger an error message on affected versions of Sudo.
Note: For a successful detection of this flaw 'perl' needs to be installed on the target host.

NVT: Missing Linux Kernel mitigations for 'iTLB multihit' hardware vulnerabilities

Product detection result
cpe:/a:linux:kernel
Detected by Detection of Linux Kernel mitigation status for hardware vulnerabili

... continues on next page ...

... continued from previous page ...

↪ties (OID: 1.3.6.1.4.1.25623.1.0.108765)

Summary
The remote host is missing one or more known mitigation(s) on Linux Kernel side for the referenced 'iTLB multihit' hardware vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The Linux Kernel on the remote host is missing the mitigation for the "itlb_mult
↪ihit" hardware vulnerabilities as reported by the sysfs interface:
sysfs file checked                                  | Linux Kernel status (SSH
↪ response)
-------------------------------------------------------------------------------
↪----------
/sys/devices/system/cpu/vulnerabilities/itlb_multihit | KVM: Vulnerable
Notes on the "Linux Kernel status (SSH response)" column:
- sysfs file missing: The sysfs interface is available but the sysfs file for th
↪is specific vulnerability is missing. This means the current Linux Kernel does
↪n't know this vulnerability yet. Based on this it is assumed that it doesn't p
↪rovide any mitigation and that the target system is vulnerable.
- Strings including "Mitigation:", "Not affected" or "Vulnerable" are reported d
↪irectly by the Linux Kernel.
- All other strings are responses to various SSH commands.
```

Solution:
Solution type: VendorFix
The following solutions exist:
- Update to a more recent Linux Kernel to receive mitigations on Kernel level and info about the mitigation status from it
- Enable the mitigation(s) in the Linux Kernel (might be disabled depending on the configuration)
Additional possible mitigations (if provided by the vendor) are to:
- install a Microcode update
- update the BIOS of the Mainboard
Note: Please create an override for this result if one of the following applies:
- the sysfs file is not available but other mitigations like a Microcode update is already in place
- the sysfs file is not available but the CPU of the host is not affected
- the reporting of the Linux Kernel is not correct (this is out of the control of this VT)

Vulnerability Detection Method
Checks previous gathered information on the mitigation status reported by the Linux Kernel.
Details: Missing Linux Kernel mitigations for 'iTLB multihit' hardware vulnerabilities

Summary
The remote host is missing one or more known mitigation(s) on Linux Kernel side for the referenced 'MDS - Microarchitectural Data Sampling' hardware vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The Linux Kernel on the remote host is missing the mitigation for the "mds" hard
↪ware vulnerabilities as reported by the sysfs interface:
sysfs file checked                          | Linux Kernel status (SSH response)
-------------------------------------------------------------------------------
↪-----------------------------------------
/sys/devices/system/cpu/vulnerabilities/mds | Vulnerable: Clear CPU buffers atte
↪mpted, no microcode; SMT Host state unknown
Notes on the "Linux Kernel status (SSH response)" column:
- sysfs file missing: The sysfs interface is available but the sysfs file for th
↪is specific vulnerability is missing. This means the current Linux Kernel does
↪n't know this vulnerability yet. Based on this it is assumed that it doesn't p
↪rovide any mitigation and that the target system is vulnerable.
- Strings including "Mitigation:", "Not affected" or "Vulnerable" are reported d
↪irectly by the Linux Kernel.
- All other strings are responses to various SSH commands.
```

Solution:
Solution type: VendorFix
The following solutions exist:
- Update to a more recent Linux Kernel to receive mitigations on Kernel level and info about the mitigation status from it
- Enable the mitigation(s) in the Linux Kernel (might be disabled depending on the configuration)
Additional possible mitigations (if provided by the vendor) are to:
- install a Microcode update
- update the BIOS of the Mainboard
Note: Please create an override for this result if one of the following applies:
- the sysfs file is not available but other mitigations like a Microcode update is already in place
- the sysfs file is not available but the CPU of the host is not affected
- the reporting of the Linux Kernel is not correct (this is out of the control of this VT)

Vulnerability Detection Method
Checks previous gathered information on the mitigation status reported by the Linux Kernel.
Details: `Missing Linux Kernel mitigations for 'MDS - Microarchitectural Data Sampling' h.`

Medium (CVSS: 5.5)

NVT: Missing Linux Kernel mitigations for 'SSB - Speculative Store Bypass' hardware vulnerabilities

Product detection result

```
cpe:/a:linux:kernel
Detected by Detection of Linux Kernel mitigation status for hardware vulnerabili
↪ties (OID: 1.3.6.1.4.1.25623.1.0.108765)
```

Summary

The remote host is missing one or more known mitigation(s) on Linux Kernel side for the referenced 'SSB - Speculative Store Bypass' hardware vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The Linux Kernel on the remote host is missing the mitigation for the "spec_stor
↪e_bypass" hardware vulnerabilities as reported by the sysfs interface:
sysfs file checked                                    | Linux Kernel status
↪(SSH response)
-------------------------------------------------------------------------------
↪--------------
/sys/devices/system/cpu/vulnerabilities/spec_store_bypass | Vulnerable
Notes on the "Linux Kernel status (SSH response)" column:
- sysfs file missing: The sysfs interface is available but the sysfs file for th
↪is specific vulnerability is missing. This means the current Linux Kernel does
↪n't know this vulnerability yet. Based on this it is assumed that it doesn't p
↪rovide any mitigation and that the target system is vulnerable.
- Strings including "Mitigation:", "Not affected" or "Vulnerable" are reported d
↪irectly by the Linux Kernel.
- All other strings are responses to various SSH commands.
```

Solution:

Solution type: VendorFix

The following solutions exist:

- Update to a more recent Linux Kernel to receive mitigations on Kernel level and info about the mitigation status from it
- Enable the mitigation(s) in the Linux Kernel (might be disabled depending on the configuration)

...continues on next page ...

...continued from previous page ...

Additional possible mitigations (if provided by the vendor) are to:
- install a Microcode update
- update the BIOS of the Mainboard
Note: Please create an override for this result if one of the following applies:
- the sysfs file is not available but other mitigations like a Microcode update is already in place
- the sysfs file is not available but the CPU of the host is not affected
- the reporting of the Linux Kernel is not correct (this is out of the control of this VT)

- the sysfs file is not available but the CPU of the host is not affected
- the reporting of the Linux Kernel is not correct (this is out of the control of this VT)
- the target host is running Xen

Affected Software/OS
Various Intel and AMD CPUs. Please see the references for the full list of affected CPUs. It particularly affects hypervisors like QEMU.

Vulnerability Insight
VMScape is a vulnerability that may allow a guest to influence the branch prediction in host userspace.
Even if a hypervisor may not have any sensitive data like disk encryption keys, guest-userspace may be able to attack the guest-kernel using the hypervisor as a confused deputy.

Vulnerability Detection Method
Checks previous gathered information on the mitigation status reported by the Linux Kernel.

Vulnerability Detection Method
Checks previous gathered information on the mitigation status reported by the Linux Kernel.
Details: `Missing Linux Kernel mitigations for 'Register File Data Sampling (RFDS)' hardw.
↪..`
OID:1.3.6.1.4.1.25623.1.0.114456
Version used: `2026-07-10T06:54:17Z`

Product Detection Result
Product: `cpe:/a:linux:kernel`
Method: `Detection of Linux Kernel mitigation status for hardware vulnerabilities`
OID: 1.3.6.1.4.1.25623.1.0.108765

[return to 172.16.30.11]

2.1.3 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary
The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0

Impact
This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:
Solution type: Mitigation
Various mitigations are possible:
- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight
The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method
Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.
Details: ICMP Timestamp Reply Information Disclosure
OID:1.3.6.1.4.1.25623.1.0.103190
Version used: 2025-01-21T05:37:33Z

[return to 172.16.30.11]

2.1.4 Low general/tcp

Low (CVSS: 3.8)

NVT: Missing Linux Kernel mitigations for 'Indirect Target Selection (ITS)' hardware vulnerability (INTEL-SA-01153)

Product detection result
cpe:/a:linux:kernel
Detected by Detection of Linux Kernel mitigation status for hardware vulnerabili
↪ties (OID: 1.3.6.1.4.1.25623.1.0.108765)

Summary
The remote host is missing one or more known mitigation(s) on Linux Kernel side for the referenced 'Indirect Target Selection (ITS)' hardware vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The Linux Kernel on the remote host is missing the mitigation for the "indirect_
↪target_selection" hardware vulnerability as reported by the sysfs interface:
sysfs file checked | Linux Kernel
↪ status (SSH response)

↪---
↪---
/sys/devices/system/cpu/vulnerabilities/indirect_target_selection | sysfs file m
↪issing (cat: /sys/devices/system/cpu/vulnerabilities/indirect_target_selection
↪: No such file or directory)
Notes on the "Linux Kernel status (SSH response)" column:
- sysfs file missing: The sysfs interface is available but the sysfs file for th
↪is specific vulnerability is missing. This means the current Linux Kernel does
↪n't know this vulnerability yet. Based on this it is assumed that it doesn't p
↪rovide any mitigation and that the target system is vulnerable.
- Strings including "Mitigation:", "Not affected" or "Vulnerable" are reported d
↪irectly by the Linux Kernel.
- All other strings are responses to various SSH commands.

Solution:
Solution type: VendorFix
The following solutions exist:
- Update to a more recent Linux Kernel to receive mitigations on Kernel level and info about the mitigation status from it
- Enable the mitigation(s) in the Linux Kernel (might be disabled depending on the configuration)
Additional possible mitigations (if provided by the vendor) are to:
- install a Microcode update
- update the BIOS of the Mainboard
Note: Please create an override for this result if one of the following applies:
- the sysfs file is not available but other mitigations like a Microcode update is already in place
- the sysfs file is not available but the CPU of the host is not affected
- the reporting of the Linux Kernel is not correct (this is out of the control of this VT)

Affected Software/OS
Various Intel CPUs. Please see the references for the full list of affected CPUs.

Vulnerability Detection Method
Checks previous gathered information on the mitigation status reported by the Linux Kernel.
Details: Missing Linux Kernel mitigations for 'Indirect Target Selection (ITS)' hardware.

dfn-cert: DFN-CERT-2025-1196

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 671999
Packet 2: 672371

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'
Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.
Details: TCP Timestamps Information Disclosure

[return to 172.16.30.11]

2.1.5 Low 22/tcp

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

Product detection result
cpe:/a:ietf:secure_shell_protocol
Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
↪)

Summary
The remote SSH server is configured to allow / support weak MAC algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The remote SSH server supports the following weak client-to-server MAC algorithm
↪(s):
umac-64-etm@openssh.com
umac-64@openssh.com
The remote SSH server supports the following weak server-to-client MAC algorithm
↪(s):
umac-64-etm@openssh.com
umac-64@openssh.com

Solution:
Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

Vulnerability Detection Method
Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm
Details: Weak MAC Algorithm(s) Supported (SSH)
